

WONDERLUST HIGH FI PROTOTYPE README

[App]

The prototype was built as an iOS app, available for download from the Diawi link below. Please follow the instructions to install our prototype.

Link to prototype: <http://install.diawi.com/sSr5YS>

[Home screen]

All experiences begin at the Home page. The list of words just below the top bar is the scrolling list that contain the available categories. Users can switch between categories by swiping the words to scroll through the list. Once a category has been selected, articles relating to the category immediately populate the bottom part of the screen. Users can view additional articles by swiping through the images. Clicking on any article (image or text) will bring it to the respective article page.

[Top bar]

The menu button, and 'W' button on the top bar are persistent throughout almost all screens of the app. The menu button opens up a drop-down menu that links to the Saved, History, Categories, and Settings (unimplemented) screens. A 'Back' button becomes visible once the user navigates beyond the Home screen, and directs back to the previous screen.

[Article Page]

This page displays the content for articles in text. The text may command more space than allowed in a single screen, and users can swipe down to continue reading. There are two buttons to the left of the screen: Save (the star) and Share (the up arrow). If implemented, the Save button would add the current article Saved screen, and Share would open up a dialog for different avenues of sharing (e.g. Facebook, Twitter).

[Saved/History Page]

The toggle button at the top indicates whether this page is currently displaying Saved items or viewed items (History). The selected mode is displayed with white text and a dark background according to iOS convention. Lists are organized based on recency, and clicking on any article in the list will bring the user to the indicated article page.

[Categories]

Finally, clicking on the Categories link will take the user directly to the Add Category screen. here a Wizard of Oz technique is employed such that the user will add the 'Art' category. Doing so will bring the user back to the Home screen with the addition of 'Art' in the scroll bar.
